

FISCHER POND (Post 1)

City's Comprehensive Plan, where it was called 'the greenbelt'. The real beginning was in the early 90's, in the form of a grant from ITD to build what is

now the southern 1/4 mile of pavement, from Fischer

Pond north, all on City Land. Then in 1995 dur-

ing the creation of Leisure Time RV Park, its river

frontage, about 1/5 of a mile, was given to the city.

At the same time another 1/3 mile of river frontage

at the north end of the Boise Cascade milisite was

given to the city. These 2 sections were then graded

and surfaced. In 2007 the Southern Valley County

Recreation District obtained an easement across

the Bureau of Land Management parcel between Leisure Time and Waters Edge, Kelly's Whitewa-

ter Park came next. In 2009 when Hans Borbonus

donated land to KWP, he also donated easements

across the former millsite to connect with the north

and south pieces of The Strand. In the fall of

2010, The Strand was truly born. Mark & Kris-

tina Pickard, the philanthropists behind Kelly's

Whitewater Park, generously paid for having the entire unpaved portion of The Strand graded &

surfaced. Cascade will forever be grateful.

Fischer Pond anchors the south end of The Strand, Thanks to the leadership of the Cascade High School Biology Department and involvement of various citizen groups over the past decade, the park has developed into a family-friendly destination that includes fisheries education, community gardens, pionic sites, volleyball, and a BBQ pavilion open for public use. It also serves as the site for the annual Free Fishing Day sponsored by Idaho Fish and Game each June. Enjoy!

BANK RESTORATION (Post 1)

Bank restoration and stabilization is underway here through the efforts of Cascade High School's Biology Department. Heavy human traffic on the porous soils at the water's edge has resulted in erosion and plant degradation. The bank is being restored through the use of native plants and limiting access to the river to specific places. Kindly let these plants flourish by not tramping on them and by using the view points.

**KELLY'S WHITEWATER PARK** The entrance is on Hwy, 55, just south of the RR Tracks. Kelly's is the first whitewater park in Idaho, attracting people to play in the man-made whitewater waves. The park stretches 1,200 feet down the Payette River as it flows past the site of the old Boise-Cascade Mill. The park is also home to a 2,660 square foot Welcome Center that overlooks the river and mountains with a gallery that showcases different local historic themes each year. The park is a beautiful place to relax, play or just be a spectator.

BANK EROSION (Post 4)

Erosion occurs when streams and rivers become inundated with more water than they can hold. This happens due to increased storm-water runoff, actual rainfall events, or a snow pack that melts too quickly. The extra water results in scouring, which is when water eats away at the banks of a river or stream. How much longer do you think a pine tree by the bank can hang on? Just past the largest of the Kelly's Whitewater Park rapids is a huge bend in the river. Notice what was done to minimize scouring there. What other ways can you think of to stabilize the bank and prevent continued scouring here?

The pine, aspen, and cottonwood trees and the chokecherry bushes in this area make this excellent habitat for both deer and red fox. During the spring and fall, deer are regular users of The Strand. Red fox also abound in the area, apparently unperturbed by sharing the space with humans. They are solitary hunters that feed on rodents, rabbits, birds, and other small game. They, however, are not picky and will eat what is available, including fruit, vegetables, fish, frogs, and

SNOWBANK MOUNTAIN (Post 3)

Look west. At 8322' tall, Snowbank Mountain is the highest peak in the West Mountains and the 29th highest peak in Idaho with over 3000' vertical rise above the valley floor. Snowbank also houses a Federal Aviation and Aeronautics (FAA) radar facility. May 31 to November 1, the summit is easily reached on a wellmaintained gravel road. There are several lakes near the summit, and the views are spectacular. On a clear day line Sawtooth Range to the east is visible. Looking west from the summit you can see the Wallowa Range in NE Oregon, and to the NW the Seven Devils Range that flanks Hells Canyon is clearly in view.

**HELPING THE BIRDS (Post 3)** 

As you walk between posts #3 and #4, notice the platforms located on posts on either side of the strand. The one lowest to the ground near the river on the east side is a goose box. The platform on the high post on the west side of the trail is designed for osprey. Osprey use the four corner posts to anchor sticks and other nest material to the platform. If you're walking north on the strand you'll see more of the osprey platforms, some with active nests.

# The Strand **CASCADE**

Take a walk along the Payette!

Enjoy your time exploring Cascade, Long Valley and the Boise National Forest.

## THE STRAND - Take a walk along the Payette River

The Strand is a nice, 10 to 12 foot wide, mostly natural surface that runs from Fischer Pond Park at the south, to Water's Edge RV Park at the north. It meanders along the Payette River, with spectacular views of the valley and surrounding mountains. The southerly 1/4 mile is paved. The entire Strand is suitable for walking and bicycles, but it is not legal for motor vehicles. The Strand is also an interpretive trail. Be sure to pick up a brochure at either end of the trail, at Kelly's Whitewater Park or the intersection with the Pine Street Connector, and learn a bit about our local history.

## LAKE CASCADE DAM (Post 12)

Lake Cascade Dam lies just upstream from you. The dam has had significant social and economic impact the region. Funding for the project was allocated in 1941; however, with the United States entering the war 1941, construction was postponed until 1946 and completed in 1948. The zoned earth-fill darn is 107' high a 785' long and backs up Idaho's 4th largest lake. Originally constructed to provide irrigation to the Emmet Valley, I lake it created has become a major recreational feature of central Idaho. The controlled water release make possible for whitewater enthusiasts to enjoy an exceptionally long season. The diversity of the fishery challeng anglers year round.

## THE AMERICAN WHITE PELICAN (Post 12)

Often during the summer you'll be able to view 10-20 of these remarkable birds on this section of the river ( many as 350 have been counted on Lake Cascade). With wingspans of 95"-120" and beaks measuring 11"-1 the pelican will dip its head underwater to scoop up fish. If you're lucky you might observe several pelica fishing cooperatively, moving into a circle to concentrate the fish and then dipping their heads under simultar ously to catch them.

### **GREAT BLUE HERON (Post 11)**

This stately heron with its subtle blue-grey plumage often stands motionless as it scans for prey or wades be deep with long deliberate steps near the far edge of the river. Don't be fooled by their apparent stowness in t water. These herons can strike like lightning to grab a fish or snap up a gopher. In flight, look for the neck a head tucked into an "S" shape and long legs trailing out behind.

## North River Access

Water's Edge RV

## BEAVER (Post 10)

Look for signs of previous beaver activity between posts 10 and The shape of most of the willows here are rounded due to the ma shoots produced after the beaver took down the tree. If you exami the base closely you'll see an older, larger stump that was gnawed beaver. Many of these stumps have been covered with wire mesh discourage the beaver from destroying the entire tree. Just upstrea from post #10 you'll see what looks like an overgrown pile of brush, active beaver lodge in 2010. A beaver can take down a tree in thr minutes, using the tree branches and trunks for construction purpos and also as a food source. As plant eaters they feed primarily on tr bark with aspens and poplars their first choice.

Park

CITY OF CASCADE (Post 11) The intersecting trail here will take you into Cascade. This town of 1000 got its start when the new Idaho Northern Railroad came to the valley and was completed in 1914. The site to become Cascade was owned by cattleman W.D. "Billie" Patterson. In 1914 he laid out the town site, offering main street lots for \$90 each and residential lots for \$50. By 1916 residents and businesses from nearby Crawford, Thunder City, and Van Wyck were moving to Cascade, which was incorporated April 5, 1917, and became the county seat of newly created Valley County.

MILL SITE CLEAN UP (Post 10)

Those piles of old logs, timbers, and compost that you looking at to the west are what is left of the Boise Ca cade Mill. The mill was closed in 2001. Subsequent removing the buildings and equipment after the closu Cloverdale Nursery of Boise got the contract to clean the site. They were able to convert 80 years of collect log debris into a commercial compost operation.

## LONG VALLEY'S NATIVE AMERICAN HERITAG

This area served as the summer hunting and gatheri location for at least three tribes: the Nez Perce to t north, the Shoshone to the southwest, and the Piute the southeast. Here tribal groups would camp duri the summer months (following the annual subsisten cycle) - hunting, fishing from the large salmon runs the Payette River and gathering choke cherries, huc lebetries, and camas root. Evidence suggests su activities occurred for hundreds of years before the fi Euro-Americans entered the area.

## Pine Street Connector

or a riparian zone?

A wetland is a land area that is saturated with water, either permanently or seasonally, so that it takes on the characteristics of a distinct ecosystem. Primarily, the factor that distinguishes wetlands from

that is adapted to its unique soil conditions. Wetlands consist primarily of hydric soil, which supports aquatic plants. They play a number of roles in the environment, principally water purification, flood control, and shoreline stability. Wetlands are also

on their wings.

STRAND

WATER SAFETY (Post 9)

If you look toward the river's edge, you'll notice a warning sign that says "Approaching dangerous whitewater, pr pare to exit river right." This is because the rapids the make up Kelly's Whitewater Park begin 100 yards dow stream and the unsuspecting and unprepared float cap find themselves in a dangerous position should the continue. Remember that when you enter an Idaho water way you are responsible for your own safety.

## BOISE CASCADE MILL SITE (Post 8)

For 80 years, Cascade was defined by "the mill". The smell of the burner and fresh cut lumber, logging truck and the whistle that signaled the shift change we inherent to living in Cascade. As the economic bac bone of the community, the mill provided a living way to 80 workers and produced more than 300,000 line feet of lumber per day.

## MILL POND (Post 8)

See the large basin that looks like an old pond just west of here? In the ea fler years of the mill, logs were stored in those millponds. A small diversit dam downstream from here raised the water level and slowed down the riv current. The head gate in front of you would be used to move water from the river to the ponds. Water storage kept the logs from splitting and cracking until they could be converted to lumber. In later years the logs were decki north and south of the mill where splitting and cracking was controlled by the use of sprinklers placed on top of the decks.

## NORTH FORK FISHERY (Post 7)

Native Americans once camped along the North Fork of the Payette, enjoying plentil runs of steelhead and salmon. With the completion of the Black Canyon Dam ne Emmett in 1924, those runs were terminated. Currently, salmonids such as whit fish and trout thrive in this section of river, between Lake Cascade Dam and Smith Ferry. You can catch perch in the slack water upstream near the north bridge.

## OSPREY NESTS (Post 6)

See the large stick nests on the old telephone poles nearby? Those belong to ospre a type of hawk that lives almost entirely on live fish. Don't confuse that white-heads osprey with an eagle; an osprey is a bit smaller and leaner with a white underbel Young bald eagles may be extensively mottled with white on their brown bodies b do not have the white head. Mature bald eagles have the characteristic white her and tail and dark body.

## WHITEWATER KAYAKING (Post 6)

Looking downstream you have a good view of the competition area of Kelly's Whitewat Park. The park is used by novice and expert freestyle kayakers alike. Spectators gat er annually to view both regional and national competitions. Built in 2009-10, the pa is composed of five separate water features that a full spectrum of kayakers can enjo as well as a beautiful welcome center in a green-space setting. The Strand pathwa continues on through the park to the north and south.

A riparian zone or riparian area is the interface between land and a river or stream. Plant habitats and communities along the river margins and banks are called riparian vegetation, characterized by hydrophilic plants. Riparian zones have a significant role in soil conservation, habitat biodiversity, and fauna and aquatic ecosystems. The word "riparian" is derived from Latin ripa, meaning river bank.
